Solving equations using evidence and zero.

So, we have (as an example)

$$x^4 + 3x^3 + 5x^2 + x = 2$$

Subtract 2 by both sides

$$x^4 + 3x^3 + 5x^2 + x - 2 = 0$$

Put x in evidence.

$$x(x^3 + 3x^2 + 5x + 1 - \frac{2}{x}) = 0$$

$$x^3 + 3x^2 + 5x + 1 - \frac{2}{x} = \frac{0}{x}$$

So, dividing zero, by x, right side

$$x^3 + 3x^2 + 5x + 1 - \frac{2}{x} = 0$$

putting x in evidence again

$$x(x^2 + 3x + 5 + \frac{1}{x} - \frac{2}{x^2}) = 0$$

$$x^2 + 3x + 5 + \frac{1}{x} - \frac{2}{x^2} = \frac{0}{x}$$

dividing zero by x, on right side.

Equation 1

$$x^2 + 3x + 5 + \frac{1}{x} - \frac{2}{x^2} = 0$$

End Equation 1

In this, case , we have a parabola formula (On equation 1)

Also,

$x^4 + 3x^3 + 5x^2 + x = 2$ is a parabola formula because of equation 1
