

Possibility of veracity of equations.

Abstract

This paper, tends to say, that all equations hold.

Proof

A equation always hold, because there are three possibilities

1) $A > B$

2) $A < B$

3) $A = B$

If , for example 1 and 2 don't hold, 3 will always hold.

Example

On Beal's conjecture, if you prove that for z , equals y , and z bigger than y , doesn't hold, do I need to prove, the case, where z smaller than y ?

Conclusion

All equations hold.
