

Non regular polygon (rectangle R1)

triangle is T1

the red triangle, T2

circle is C1

s, equals radius of C1, which is two

Since  $\alpha$  is the same as  $\beta$ , we can create the rectangle R1

the triangle, which sides are red, is inside the circle at the right (that is denoted in black)

height of triangle T2, is equal to radius of circle.  $r = 2$  (radius of circle)
